Iterating over dictionaries using 'for' loops

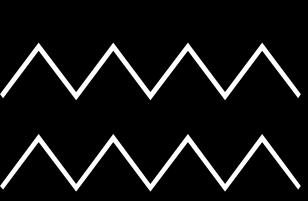

Asked 10 years, 4 months ago Active 1 month ago Viewed 4.5m times

I am a bit puzzled by the following code:

```
3343 d = {'x': 1, 'y': 2, 'z': 3}
    for key in d:
        print key, 'corresponds to', d[key]
```

682 What I don't understand is the `key` portion. How does Python recognize that it needs only to read the key from the dictionary? Is `key` a special word in Python? Or is it simply a variable?

python python-2.7 dictionary

Types of Websites

Static Websites: Content remains the same unless manually updated -
Example: Blog pages, Wikipedia

Dynamic Websites: Content changes dynamically via JavaScript or AJAX -
Example: Facebook, Twitter, E-commerce sites

Understanding HTML Structure

- HTML is the backbone of web pages

- Important tags:
'<div>', '',
'<a>', '<table>',
'<p>'

- Use browser
**Inspect
Element** tool to
analyze HTML

Important HTML Attributes

Attribute	Description	Example Usage
id	Unique identifier for an element	<code><p id="intro">Hello</p></code>
class	Specifies one or more class names	<code><div class="container">Content</div></code>
style	Inline CSS styling	<code><h1 style="color: red;">Heading</h1></code>
src	Specifies the source URL	<code></code>
alt	Alternative text for images	<code></code>
href	Specifies the link destination	<code>Visit</code>
target	Opens link in new tab (_blank)	<code>Open</code>
title	Tooltip text on hover	<code><p title="This is a tooltip">Hover me</p></code>
name	Used in form elements	<code><input type="text" name="username"></code>
value	Default input field value	<code><input type="text" value="Default Text"></code>

Important HTML Attributes

Attribute	Description	Example Usage
value	Default input field value	<code><input type="text" value="Default Text"></code>
placeholder	Hint inside an input field	<code><input type="text" placeholder="Enter your name"></code>
type	Defines input field type	<code><input type="password"></code>
readonly	Makes an input field uneditable	<code><input type="text" value="Fixed" readonly></code>
disabled	Disables an input field or button	<code><button disabled>Click Me</button></code>
checked	Preselects a checkbox or radio	<code><input type="checkbox" checked></code>
selected	Preselects an option in dropdown	<code><option selected>Option 1</option></code>
maxlength	Limits input characters	<code><input type="text" maxlength="10"></code>
required	Makes a field mandatory	<code><input type="email" required></code>
rows	Specifies visible rows in textarea	<code><textarea rows="4"></textarea></code>
cols	Specifies columns in textarea	<code><textarea cols="50"></textarea></code>
data-*	Custom attributes for JavaScript	<code><div data-user="123">User Info</div></code>

Introduction to Web Scraping

What Is Web Scraping?

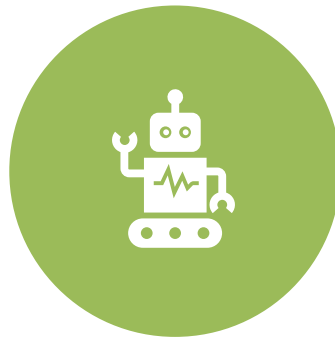

General

Introduction to Web Scraping

- EXTRACTING DATA FROM WEBSITES AUTOMATICALLY

- USED IN DATA ANALYSIS, MARKET RESEARCH, AND AUTOMATION

- ETHICAL AND LEGAL CONSIDERATIONS (ROBOTS.TXT, TERMS OF SERVICE)

Python Libraries for Web Scraping

1. Requests – Fetches web pages

2. BeautifulSoup – Parses HTML and XML

3. Selenium – Interacts with JavaScript-heavy pages

4. Scrapy – For large-scale scraping

Simple Web Scraping Example

Using `**BeautifulSoup**` to extract titles from a static website:

```
import requests
from bs4 import BeautifulSoup

url = 'https://example.com'
response = requests.get(url)

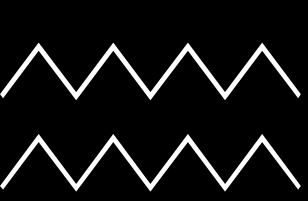

soup = BeautifulSoup(response.text, 'html.parser')

titles = soup.find_all('h2')

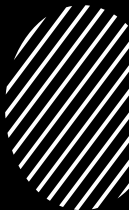

for title in titles:
    print(title.text)
```

Is Webscraping Illegal?

Conclusion and Q&A

- Web scraping is a powerful tool for data extraction

- Choose the right library based on website type

- Always follow ethical and legal guidelines
